Software Project Management

Week 11

Personal Project Dashboard

Project Name: Student Cybersecurity Awareness Website

RAG Status: AMBER (Some delays, but project is still under control)

Key Accomplishments:

Completed project planning and research

Designed website layout and structure

Developed basic frontend pages

Tested initial features

Current Risks / Issues:

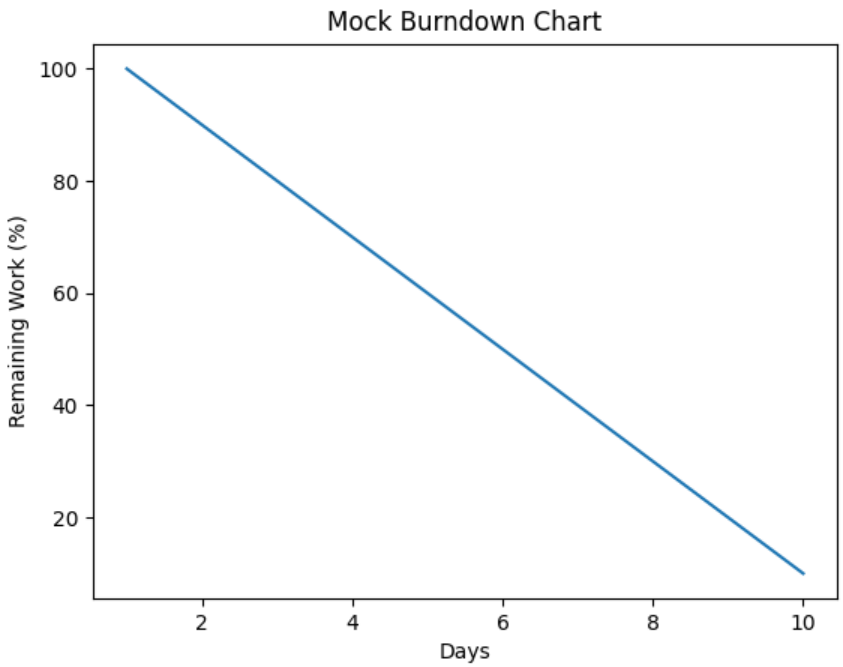
Limited time for development

Lack of advanced technical skills

Possible delays in testing phase

Internet connectivity issues

Project Chart



Reflection

Summarizing the project status into a one-page dashboard was challenging because it required selecting only the most important information. It was difficult to decide what to include and what to leave out, especially when the project had many small details. Another challenge was simplifying technical progress into clear and easy-to-understand points. Creating the RAG status also required careful thinking to accurately reflect the current state of the project without exaggerating progress. In addition, identifying risks forced me to think critically about possible problems that could affect the project in the future. Overall, the process helped improve my ability to communicate project information clearly and concisely.

Tool Exploration and Comparison

Feature	Jira	Trello
Schedule Tracking	Advanced sprint planning and timelines	Basic boards an
Cost Tracking	Limited, requires plugins	Not built-in

Scope Tracking	Detailed backlog and issue tracking	Simple card-bas

For a small Agile team, Trello is the better choice compared to Jira. This is mainly because Trello is simple, easy to use, and does not require much training. Small teams usually do not need complex tools with many features, and Trello provides just enough functionality to manage tasks effectively. Trello uses a visual board system where tasks are organized into columns such as To Do, In Progress, and Done. This makes it easy for team members to understand the project status at a glance. On the other hand, Jira is more powerful and offers advanced features such as sprint planning, backlog management, and detailed reporting. However, these features can be overwhelming for small teams and may slow down productivity. Jira is better suited for large teams or complex projects that require detailed tracking. Although Trello does not have built-in cost tracking or advanced reporting, it is still effective for managing scope and schedule in a simple way. Overall, Trello is recommended for small Agile teams because it is easy to learn, quick to set up, and supports collaboration without unnecessary complexity.
